-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- PTM: A proteolytic cleavage generates a new amino terminus that functions as a tethered ligand.
-!- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                     InterPro; ITM, 00276; GPCR_Rhodpsn.

J. Biol. Chem. 267:16975-16979 (1992).

J. FUNCTION: High affinity receptor for activated thrombin coupled to G proteins that stimulate phosphoinositide hydrolysis.

J. SUBCELLULAR LOCATION: Integral membrane protein.

FIN: A proteolytic cleavage generates a new amino terminus that functions as a tethered ligand.

SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           74 DYYYYFFNWRWGEMACRIMSFLSYINTYVSINFWTWISVNRYYAVTRPHKYNSRDNIWRT

Migh affinity receptor for activated thrombin coupled ---- FUNCTION: High affinity receptor for activated thrombin coupled G proteins that stimulate phosphoinositide hydrolysis.
---- SUBCELLULAR LOCATION: Integral membrane protein.
---- PTM: A proteolytic cleavage generates a new amino terminus that functions as a tethered ligand.
---- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      N-LINKED (GLCNAC. ..)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DEACH. CHEM. 272:12583-12590(1997).

BIOL. CHEM. 272:12583-12590(1997).

FUNCTION: RECEPTOR FOR EXTRACELLIDAR ATP, UTP, CTP, GTP AND ITP.

THE ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH
ACTIVATE A PHOSPHATIDYLINOSITOL-CALCIUM SECOND MESSENGER SYSTEM.

MAY PLAY A KEY ROLE IN THE BARLY DEVELOPMENT OF NEURAL TISSUE.

SUBCELLULAR LOCATION: Integral membrane protein.

SUBCELLULAR BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Xenopus laevis (African clawed frog).

Eur. J. Immunol. 28:582-588(1998).

-!- FUNCTION: Receptor for the chemokines SCYA1/I-309, SCYA4/MIP-1-beta and SCYA1/TARC. May regulate monocyte chemotaxis and thymic cell line apoptosis. Alternative coreceptor with CD4 for HIV-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MAN, DV.1637, DV.1637, C. integral to plasma membrane, TAS.

This response is mediated via a G-protein that activates a phosphatidylinositol-calcium second messenger system (By similarity). SUBCELLULAR LOCATION: Integral membrane protein.

SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Takasaki J., Kamohara M., Saito T., Matsumoto M., Matsumoto S., Ohishi T., Soga T., Matsushime H., Furuichi K.; "Characterization of cloned rat and porcine cysteinyl leukotriene

-1. FUNCTION: HIGH AFFINITY RECEPTOR FOR THE C-C TYPE CHEMOKINES
TARC/SCYA17 AND MOC/SCYA22. THE ACTIVITY OF THIS RECEPTOR IS
MEDIATED BY G(I) PROTEINS WHICH ACTIVATE A PHOSPHATDYLINOSITOL-
CALCIUM SECOND MESSENGER SYSTEM. CAN FUNCTION AS A CHEMOATRACTANT
HOMING RECEPTOR ON CIRCULATING MEMORY LYMPHOCYTES AND AS A
CORECEPTOR ON CIRCULATING MEMORY LYMPHOCYTES AND AS A
CORECEPTOR ON CIRCULATING MEMORY LYMPHOCYTES AND AS A
CORECEPTOR ON CIRCULATING MEMORY LYMPHOCYTES IN THE CNS, COULD
MEDIATE HIPPOCAMPAL-NETRON SURVIYAL.

-1. SUBCELLULAR LOCATION: Integral membrane protein.

-1. SUBCELLULAR LOCATION: Integral membrane protein.

-1. SUBCELLULAR LOCATION: Integral membrane protein.

-1. SUBCELLULAR LOCATION: Integral membrane protein.

-1. SUBCELLULAR LOCATION: Integral membrane Tevels, IN THE SPLEEN
AND BASOPHILLS, AND IN PLATELETS; AT LOWER LEVELS, MOSTLY THE
CONSE SPRESSING THE CUTANEOUS LAND MEMORY T CELLS, MOSTLY THE
CONSE SPRESSING THE CUTANEOUS LAND MEMORY T CELLS.

-1. PTM: IN NATURAL KILLER CELLS, SCYA22 BINDING INDICES
CONSE SPRESSING THE CUTANEOUS LAND SOCKIARY ARTERY ENDOTHELIAL CELLS.

-1. PTM: IN NATURAL KILLER CELLS, SCYA22 BINDING INDICES
CONSE SPRESSING RECEPPOR KINASES 1 AND 2.

-1. SIMILARITY: BELONGS TO PAMILY 1 OF G-PROTEIN COUPLED RECEPPORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. Kekuda R; Smithson G, Ellerman K, Edinger SR, Muralidhara P; Casman SJ,

2002-643487/69. N-PSDB; ABS64723 New isolated G protein coupled receptor polypeptides and polynucleotides, useful in gene therapy, particularly for treating preventing cardiomyopathy, atherosclerosis, diabetes, multiple polynucleotides, useful in gene therapy preventing cardiomyopathy, atherosclero sclerosis, Crohn's disease or cancer

Claim 1, Page 98; 252pp; English.

This invention relates to a new isolated G-protein coupled receptor

(GPCRX) polypeptide, GPCRX nucleic acid and an antibody specific to the protein

are useful of GPCRX nucleic acid and an antibody specific to the protein

are useful for treating, preventing or alleviating a GPCRX-associated

disorder or a pathological state in a subject, particularly a human. In

particular, the disorder is cardiomyopathy, atherosolerosis, diabetes,

or a disorder related to cell signal processing and metabolic pathway

or adisorder related to cell signal processing and metabolic pathway

or adisorder related to cell signal processing and metabolic pathway

or adisorder related for predisposition to a disease associated

with altered levels of GPCRX, particularly cancer. The GPCRX nucleic

disponsing the presence of or predisposition to a disease associated

with altered levels of GPCRX, particularly cancer. The GPCRX nucleic

considerament for therapeutic or prophylactic applications for disorders

associated with aberrant GPCRX expression or activity, e.g. von

Hippel-Lindau syndrome, Alzheimer's disease, stroke, tuberous

considerated with aberrant GPCRX expression or activity, e.g. von

Hippel-Lindau syndrome, Alzheimer's disease, stroke, tuberous

considerated with aberrant GPCRX expression, attain-index of disease,

constant the pale of a level of the procession or activity, bowel

constant the pale of the procession or activity, and alsease,

constant the pale of the procession or activity, and and activity attain, and and and activity hypertension, coleroderma, inamposing the procession

constant the pale of produce antibodies and as vaccines. The mucleic acids are improved in sease. The DNA encoding the procession or produce antibodies and as vaccines. The mucleic acids are further used as hybridiation probes, in chromosome mapping, tissue

constant disease. The DNA encoding the procession or the present of in developing powerful as and pharmacogenomics. These are also useful

indexident the procession or activity or human disorders, as well as in diagnostic applications. The present sequence represents a human G protein coupled receptor related protein sequence represents a hu (GPCR) of the invention. represents a

Novel nucleic acids and polypeptides for diagnosis, treatment of inflammatory, autoimmune, nervous system, myeloid or lymphoid cell disorders, cancer and promoting wound healing -

Claim 10; Page 600; 672pp; English.

The invention relates to human novel polymucleotides and associated correct the invention relates to human novel polymucleotides are useful for treating inflammatory conditions such as arthritis, mebhritis, Crohn's disease, ischaemia-reperfusion injury, abock, sepsis, immune responses and cancer and for promoting wound healing. The sequences are used to induce the proliferation of neural cells and regeneration of nerve and contains and are useful for the treatment of central and partipheral nearous system diseases and neuropathies, such as Alzheimer's disease, Dazin tissue, The sequences are involved in chemotactic or chemokinetic sclerosis. The sequences are involved in chemotactic or chemokinetic activity, regulation of hazantopolesis, treatment of myeloid or lymphoid cell disorders and platelet disorders such as thrombocytopenia, regeneration of bone, carrilage, tendon, ligament and/or nerve tissue contains, sequences of the invention are also useful for gut disease. The sequences of the invention are also useful for gut protection or regeneration and treatment of lung or librosis. Creperfusion injury in various tissues, immune deficiencies and disorders infections, allergic conditions such as asthma, thrombolysis or thrombosis and coagulation disorders. Sequences ABG66666-ABG66758 represent human converse.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the worker. The sequences (I) is useful as hybridisation probes, polypeptide (II) sequences (I) brimers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical in sorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. Abg00010-Abg30177 represent novel human call amino acid sequences of the invention.

Specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                  The invention relates to novel isolated nucleic acid molecules encoding G protein-coupled receptors termed nGPCR-x. nGPCR-x polynucleotides, C polyapeptides, and modulators may be used in the transment of diseases and conditions such as infections, much as viral infections caused by HIV-1 (human immunodeficiency virus) or HIV-2, pain, cancers, metabolic and cardiovascular diseases and disorders (e.g., type 2 diabetes, obesity, annexis, hypotension, hypotension, myocardial infarction, and cardioratial disorders, including schizophrenia, migraine, major neurological disorders, including schizophrenia, migraine, major cherosclerosis, such as Huntington's disease or Tourette's Syndrome dyskinesias, such as Huntington's disease or Tourette's Syndrome condulators, may other diseases and syndromes listed in the specification.

C and many other diseases and syndromes listed in the specification.

C noptors, may also be used in diagnostic assays for such diseases or and antity of the invention sequence represents a G protein-coupled

Sequences AAU25554-AAU25616 represent human G-protein coupled receptor. (GPCR) polypeptides of the invention. The proteins and their associated DNA sequences can be used to identify compounds which bind to GPCR polypeptides and in screening for compounds that modulate GPCR activity. By screening a human subject for the presence of mutations in GPCR DNA, a GPCR-related disorder or a genetic predisposition can be diagnosed. The sequences can also be used for treatment and prevention of mental disorders such as schizophrenia, attention deficit disorder, anxiety, depression, dementia and bipolar disorder, neurological disorders such as huntington's disease and Tourette's syndrome, metabolic disorders such as obesity, anorexia and type 2 diabetes, cardiomyopathy and atherosclerosis, wiral infections caused by HIV and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid encoding a new G-protein coupled receptor polypeptide for detecting receptor modulators that can treat mental disorders, such as schizophrenia, anxiety, depression, or obesity -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Drosophila; developmental biology; cell signalling; insecticide;

The invention relates to novel human secreted polypeptides. The polypeptides are useful for polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying atterapeutic agent for use in treatment of a pathology related to aberrant expression or
                                                                                                                                                                                                                                                           The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention signatorics genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, vaccination, gene therapy, nutritional supplement, stem cell proliferation, haematopoiesis, nerve tissue regeneration; immune suppression, immune stimulation, anti-inflammatory, leukaemia.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell.—cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical furugs. The invention discloses, consequences (ABL1615-ABL30511), expressed DNA sequences (ABL16175-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequence data for this patent did not form part of the printed scification, but was obtained in electronic format directly from WIPO ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and thereby, and can be used as nutritional supplements. They may be used tincrease stem cell proliferation; to regulate haematopoiesis, and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias AAUS9510-AAU3304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                           Gaps

The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. They may be used to increase stem cell prodiferation, to reginate the proteins of the polypeptides and cells genetically confineered to express them are also useful for producing the proteins. They may be used to increase stem cell prodiferation, to reginate haematopoiesis, and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; impure suppression and/or stimulation, as anti-inflammatory agents; and in treatment of leukaemias. AAU2510-AAU3304 represent the amino acid in treatment of leukaemias. AAU2510-AAU3304 represent the amino acid sequences of novel human secreted proteins of the invention.

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27522 encode the human ORFX proteins are useful for in the specification approach of the manufacture of a medicament for treating a creating a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polymucleotide capturence can be used in gene therapy. ORFX sequences can be used in the therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumnours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, disorders related to organ transplantation, cardiovascular diseases, disorders, infectious disease, autoimmune disorders such as multiple sclerois, rheumatoid arching, autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, incisions, ulcers, for treating osteoporosis, conceptuation or regeneration and treatment of lung or liver fibrosis, mystemic cytokine damage.

Consequence of lung or liver fibrosis, when the printer of lung or liver fibrosis, when the comment of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the printer of the print
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             86 AA;

                                                                                                                 Human novel polypeptide #476.
                                                                                                                                                                                                                                                     Homo sapiens.
                                                                                        18-MAR-2003
                                                               ABU55389;
                                                 The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliotate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked include autoimmune disease e.g. rheumatoid arthritis, include autoimmune disease e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebral adsorders e.g. cardiac arrest, cerebral adsorders e.g. cardiac arrest, cerebral disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection, and many other of prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotraxis. The polypeptides can also be used as a food additive or preventive to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other mutritional components. The present sequence represents a novel secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid molecules encoding 461 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3.1%; Score 11; DB 22; Length 94;

                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human novel polypeptides and their associated polynucleotides. The polypeptides and polynucleotides are useful in gene therapy for traating, inhibiting or preventing neural disorders, immune system disorders (e.g. systemic lupus erythematosus, rheumatoid arthritis and multiple sclerosis), muscular disorders, respiratory diseases (e.g. nasal vestibulitis, nasal polyps and simusitis), reproductive disorders, gastrointestinal disorders, pulmonary disorders, cardiovascular disorders (e.g. congenital heart defects, Ebstein's anomaly and hypoplastic left heart syndrome), renal disorders (e.g. acute kidney failure and end-stage renal disease), hyperprofilerative disorders (e.g. Hoddxin's disease and leukaemia), inflammatory diseases (e.g. conditions (e.g. asthma), blood related disorders (e.g. thrombosis, atherosclerosis and myocardial infarction) and cancerous diseases.

Sequences ABUSSA914-ABUSSA99 and ABUSS748 represent human novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                           New polypeptides and nucleic acids, useful in gene therapy for treating, inhibiting or preventing e.g. neural, immune system, muscular, respiratory, reproductive, gastrointestinal, pulmonary, cardiovascular or renal disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia,
hypercholesterolaemia, coronary heart disease.

The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes indentified may be involved in genetic liver diseases such as cirrhosis, hyperliopproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent Numan liver single exon encoded peptides of the invention.

Note: The sequence information for this patent does not appear in the printed specification but, was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; foetal liver; gene expression; single exon nucleic acid probe.

Protein #8223 encoded by probe for measuring heart cell gene expression.
                                                                                                                    The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human feetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart ABA21535-ABA41305). The present sequence is a protein encoded by one

ö
probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardidac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at tp.wipo.int/pub/published_pct_sequences.

GENERAL INFORMATION:
APPLICANT: Clark, Stephen C.
APPLICANT: Turner, Katherine
APPLICANT: Turner, Katherine
APPLICANT: Turner, Katherine
APPLICANT: Turner, Katherine
APPLICANT: Hawick, Rodney M.
TITLE OF INVENTION: Megakaryocyte Stimulating Factors
NUMBER OF SEQUENCES: 143
CORRESPONDENCES: 143
CORRESPONDENCES: 161
STATE: ADDRESSEE: Genetics Institute, Inc.
STATE: Massachusetts
APPLICANT: Turner, Katherine
APPLICANT: Hewick, Rodney M.
TITLE OF INVENTION: Megakaryocyte Stimulating Factors
NUMBER OF SEQUENCES: 143
CORRESPONDENCE ADDRESS:
ADDRESSEE: Genetics Institute, Inc.
STREET: 87 Cambridge

Sequence 76, Application US/07757022B

Patent No. 643342

GENERAL INFORMATION:

APPLICANT: Clerk, Stephen C.

APPLICANT: Turner, Katherine

APPLICANT: Turner, Katherine

APPLICANT: Hewick, Rodney M.

TITLE OF INVENTION: Megakaryocyte Stimulating Factors

NUMBER OF SEQUENCES: 143

CORRESPONDENCE ADDRESS:

ADDRESSEE: Genetics Institute, Inc.

STREET: 87 CambridgePark Drive

CITY: Cambridge

STREET: Massachusetts

COUNTRY: U.S.A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 11, DB 4; Length 209; Pred.
